

# Innovative Data Collection Using Big Data Analytics

May 19, 2021

# Meeting With You Today

**Amir Rizavi, PE, ENV SP**  
Director of Transportation Systems

**Steve Anderson, GISP**  
Director of Applied Technology

# Our Vision

A transportation planning tool that combines big data analytics and traditional traffic analysis to identify traffic data at intersections more efficiently than ever before, without the need for traditional manual or electronic counts.

# How Are We Collecting Data?

"If **“big data” products such as INRIX** or Street Light are used, this should be discussed in advance with the appropriate local government and VDOT land development manager, or **in the case of VDOT planning studies, with Traffic Engineering and Transportation Planning**. Data should have been **collected between to January 1 2017 and March 15 2020.**" – VDOT NoVA, *Recommended Alternative Traffic Count Procedure*

"Where no TMCs exist, Traffic Signal Warrants **may be estimated using third-party sensor or probe data**, estimates based upon ATRs, or combinations thereof, upon authorization from the State Traffic Engineer." – MassDOT, *Guidance on Traffic Count Data*

"Third-party vendor data, with origin-destination information prior to March 12, 2020, **can be used to estimate percentages** of turning movements." – PennDOT, *COVID-19 Traffic Data Guidance*

TO: NoVA District Land Use Engineers  
COPIES: NOVA Transportation Planning Section, NoVA Traffic Engineering, NoVA TLUDs  
FROM: Norman Whitaker, AICP, District Transportation Planning Director  
DATE: May 21, 2020  
SUBJECT: Recommended Interim Practices for Traffic Counts Collected for Planning Studies and Chapter 527 Traffic Impact Analyses (TIAs)

The interim practices described below were developed in collaboration with the NoVA Land Development Managers, NoVA Traffic Engineering, and Central Office Land Development and Traffic Engineering. Advice from Central Office TMPD regarding sources of alternate counts for planning studies was also incorporated. We received comments from Loudoun, Fairfax and Prince William Counties, and revised earlier drafts in response to these comments. Fairfax and Loudoun Counties have developed interim policies for accepting alternative counts submitted with TIAs, and these policies seem consistent with our broad framework document.

It should be noted that these interim practices are intended for TIAs submitted to NoVA District Land Development Managers and for planning studies conducted by VDOT NoVA District. They are not intended for project design work or for studies that are subject to Federal oversight, such as project level NEPA studies, interchange justification reports or interchange Modification Reports.

---

### Recommended Alternative Traffic Count Procedure

VDOT NoVA, 5.21.20

**Purpose:** Provide VDOT, local governments and consultants with guidance on practices for obtaining traffic count data during the current Covid-19 emergency and similar prolonged periods when it is not safe or desirable to collect "fresh" counts. This procedure is intended for Chapter 527 TIA's submitted to VDOT NoVA and planning level studies managed by NoVA District staff.

**Objectives and Guiding Principles:**

- Recognize that work cannot come to a halt during the current Covid-19 crisis and future similar emergencies.
- Recognize that most traffic count data collected between March 15, 2020 and a point in time in the future when VDOT determines traffic is reasonably normalized will not be acceptable for TIAs and planning studies due current atypical travel behavior.
- Comply with applicable Commonwealth of Virginia guidelines, regulations and legislation.
- Use best planning/engineering judgement and make use of the flexibility in the Guidelines.

**TRAFFIC DATA**

pennsylvania  
DEPARTMENT OF TRANSPORTATION  
494-20-04

... has analyzed traffic volumes since 20. Closure of schools, non-life-...  
... in significant decreases in traffic...  
... take months or even years, and the...  
... traffic counts collected after...  
... volumes without applying...  
... business closures and stay at...  
... ance by the District Traffic Engineer

... in 262 (Appendix A) and the Design...  
... could be approved as part of the...  
... projects with an approved Scoping...  
... 2020 but which did not collect traffic...  
... data collection plan to supplement...  
... collected.

Section 10.2 of Publication 46 addresses the use of engineering judgment for traffic studies to determine the appropriate time during which to conduct a traffic count.

Following are some resources to identify appropriate factors to adjust traffic volumes:

- TIRe (<https://gis.pennidot.gov/TIRe/>): hourly count data from permanent and portable count stations can be obtained by clicking on the station and then choosing "Open Reports" from the pop-up box. Hourly data can be obtained by clicking on available dates in the next screen.

Summary of Maintenance and Operations  
400 North Street, 6th Floor, Harrisburg, PA 17120 | TEL: 717-539-9100 | [www.pennidot.gov](http://www.pennidot.gov)

# INTERSECT

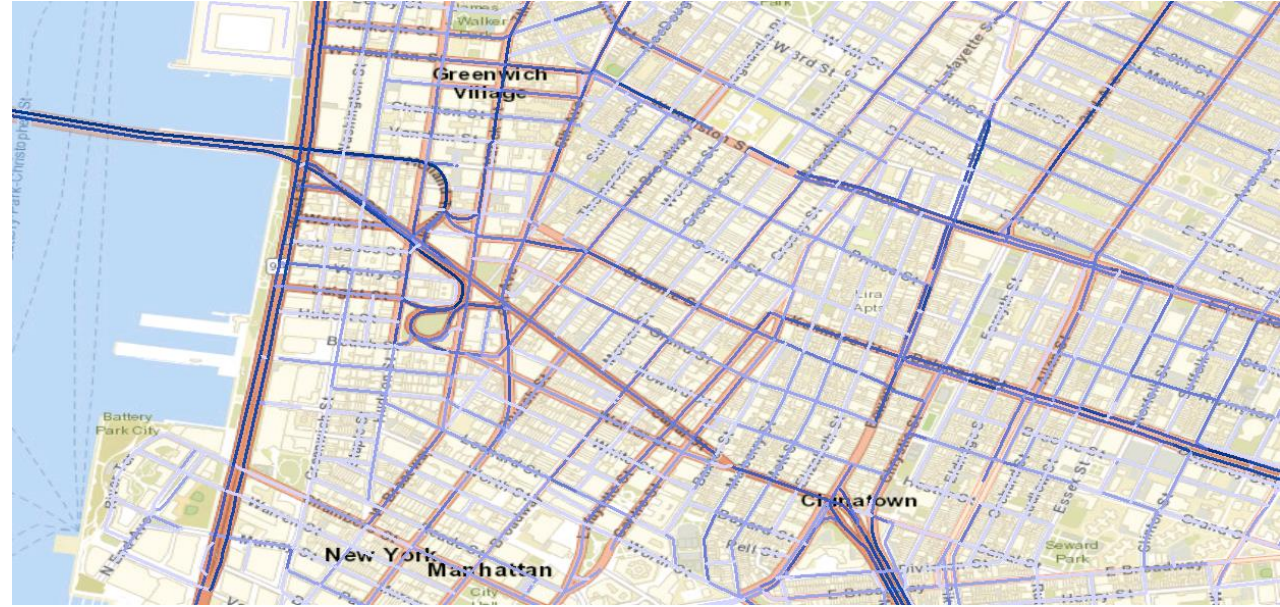

WHERE DATA AND RESULTS CONVERGE

VHB's latest [technology-driven innovation](#) revolutionizes the way we account for traffic volumes at urban, suburban, or rural intersections during typical and atypical circumstances. Intersect leverages [big data](#) and [traffic analysis](#) to keep critical projects moving forward.

# Starting Trip Locations—All Vehicles, 1 Day

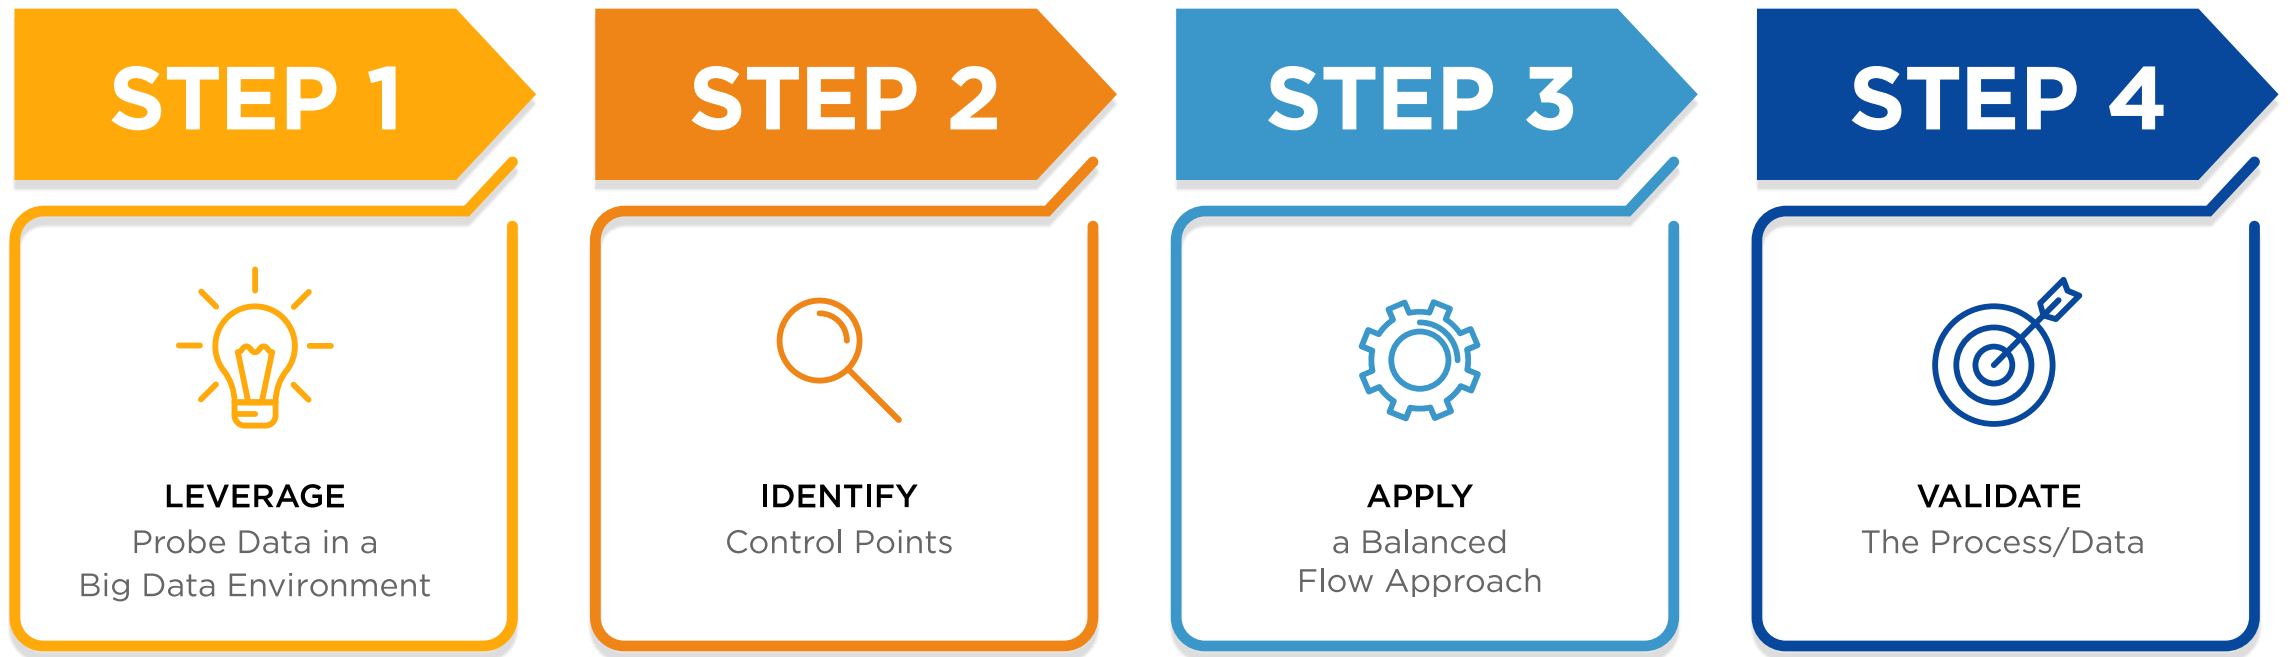

# Intersect Procedures

# Intersect's Innovative Process

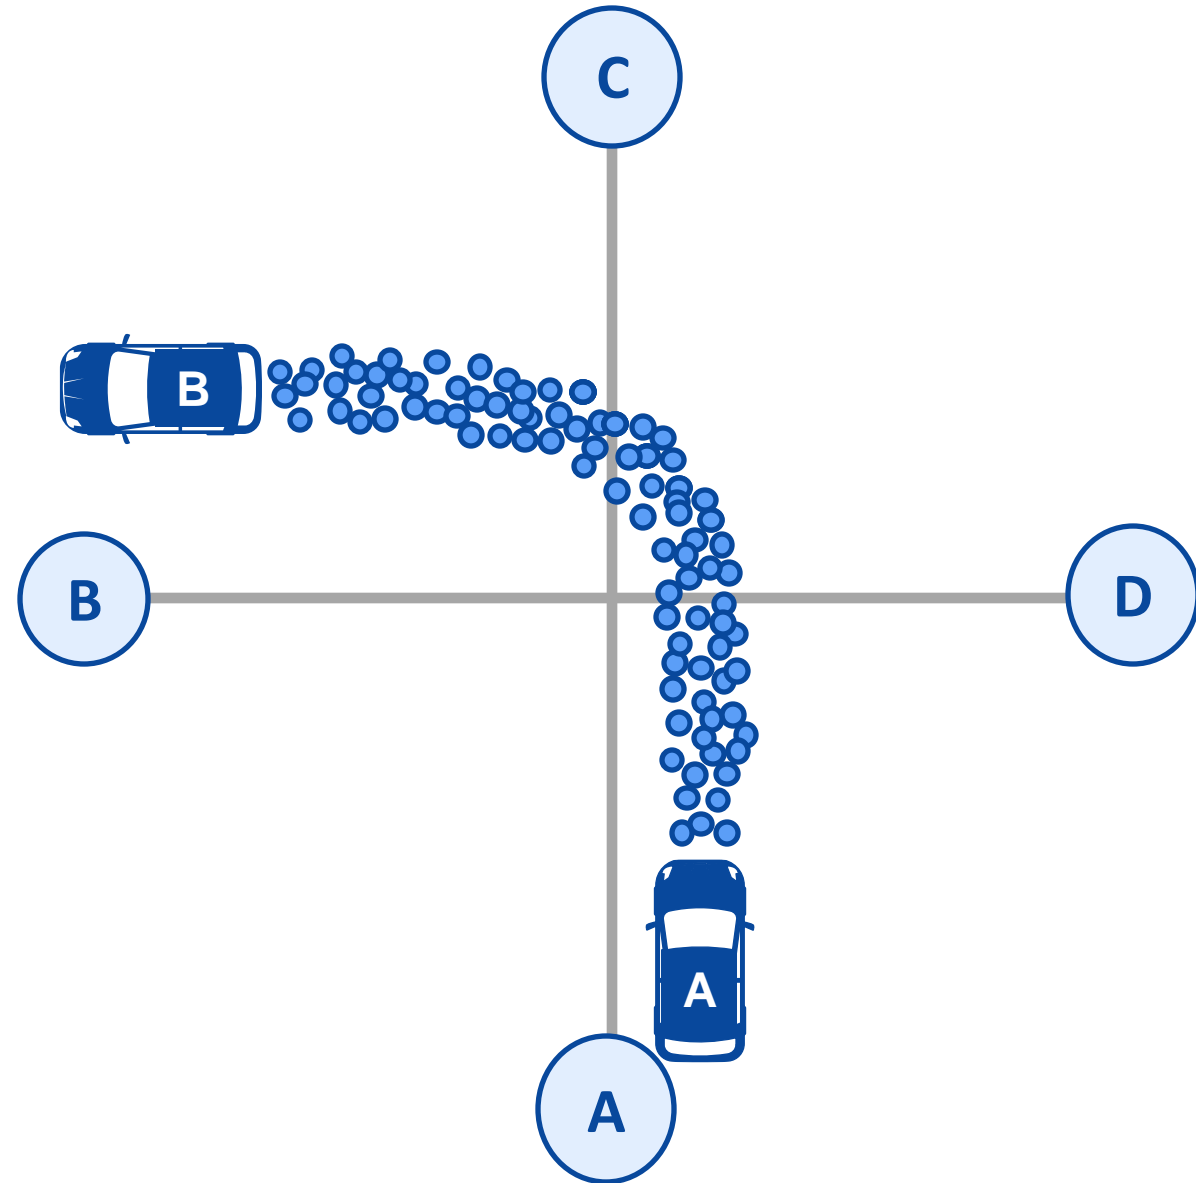

## STEP 1

### Intersect Leverages Probe Data in a Big Data Environment

- Identify turn % or volumes
- Continuous collection
  - Time of day
  - Day of week
- Seasonal adjustments (multiple days)

# Percent Turns Using Probe Data

$$\begin{aligned} \text{\% Left Turns} &= \frac{\sum_{4-6pm} \textit{Point A} \rightarrow B}{\sum_{4-6pm} \textit{Point A} \rightarrow B + \sum_{4-6pm} \textit{Point A} \rightarrow C + \sum_{4-6pm} \textit{Point A} \rightarrow D} \\ &\quad (4-6 \text{ pm}) \end{aligned}$$

## STEP 2

### Intersect Identifies Control Points

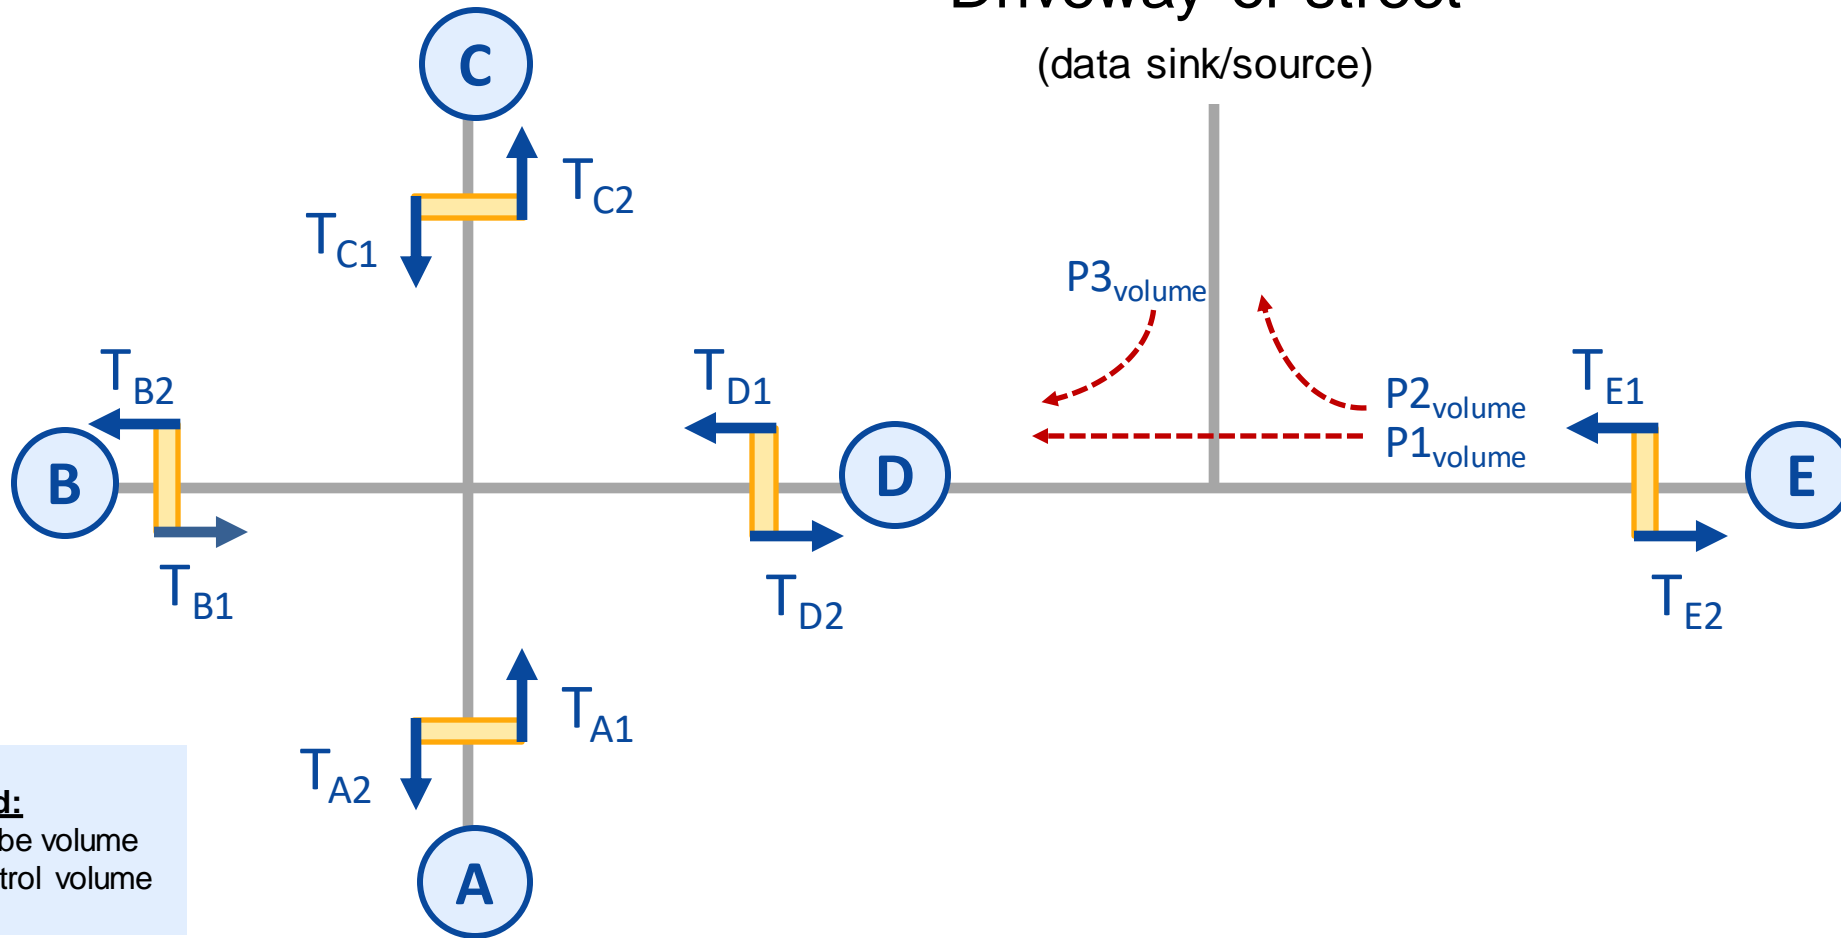

- Permanent/portable count stations
- Sensors
- Local or private counts
- Capture rates

# Driveway or street

(data sink/source)

## Legend:

P – probe volume  
T – control volume

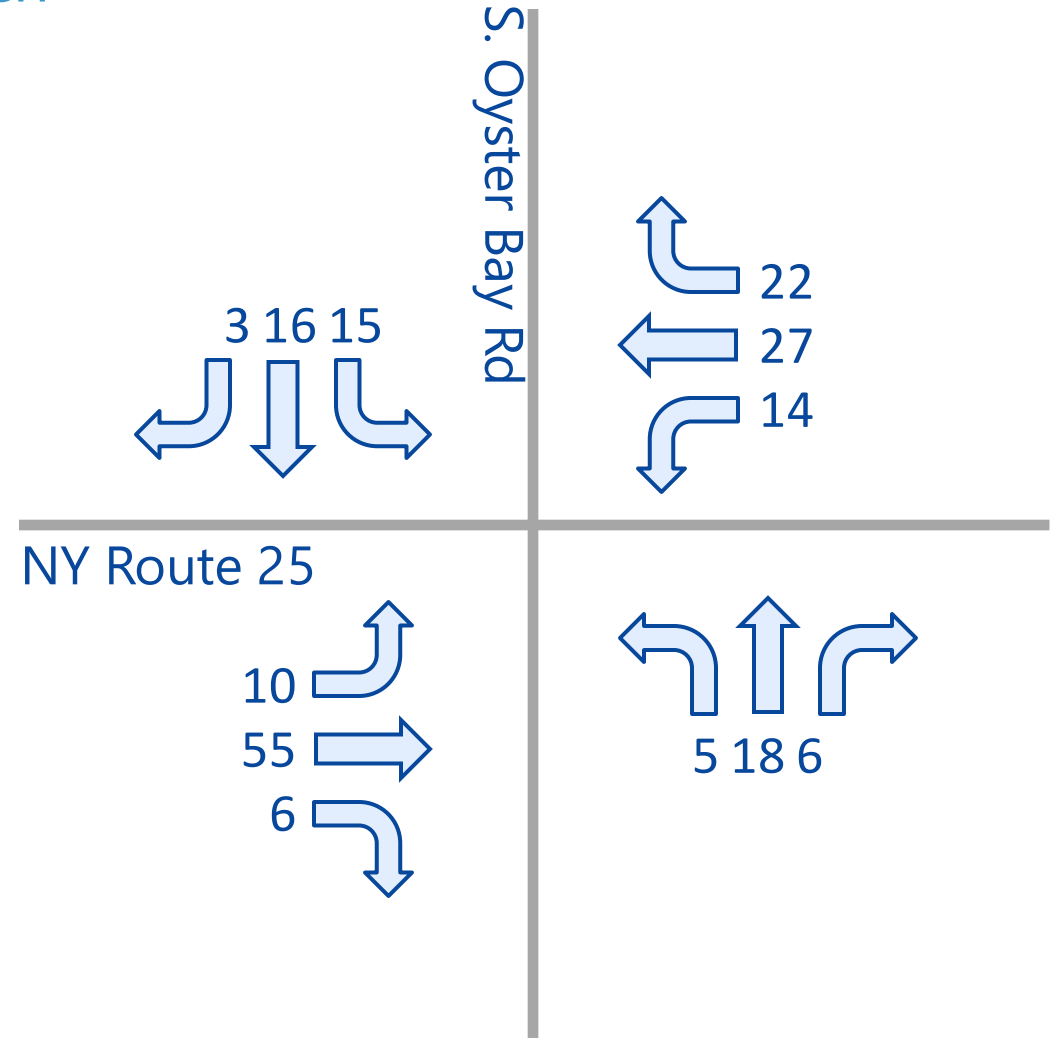

$$T_{D1} = \left[ T_{E1} \times \frac{P1_{\text{volume}}}{(P1_{\text{volume}} + P2_{\text{volume}})} \right] + \left[ T_{E1} \times \frac{P3_{\text{volume}}}{(P1_{\text{volume}} + P2_{\text{volume}})} \right]$$

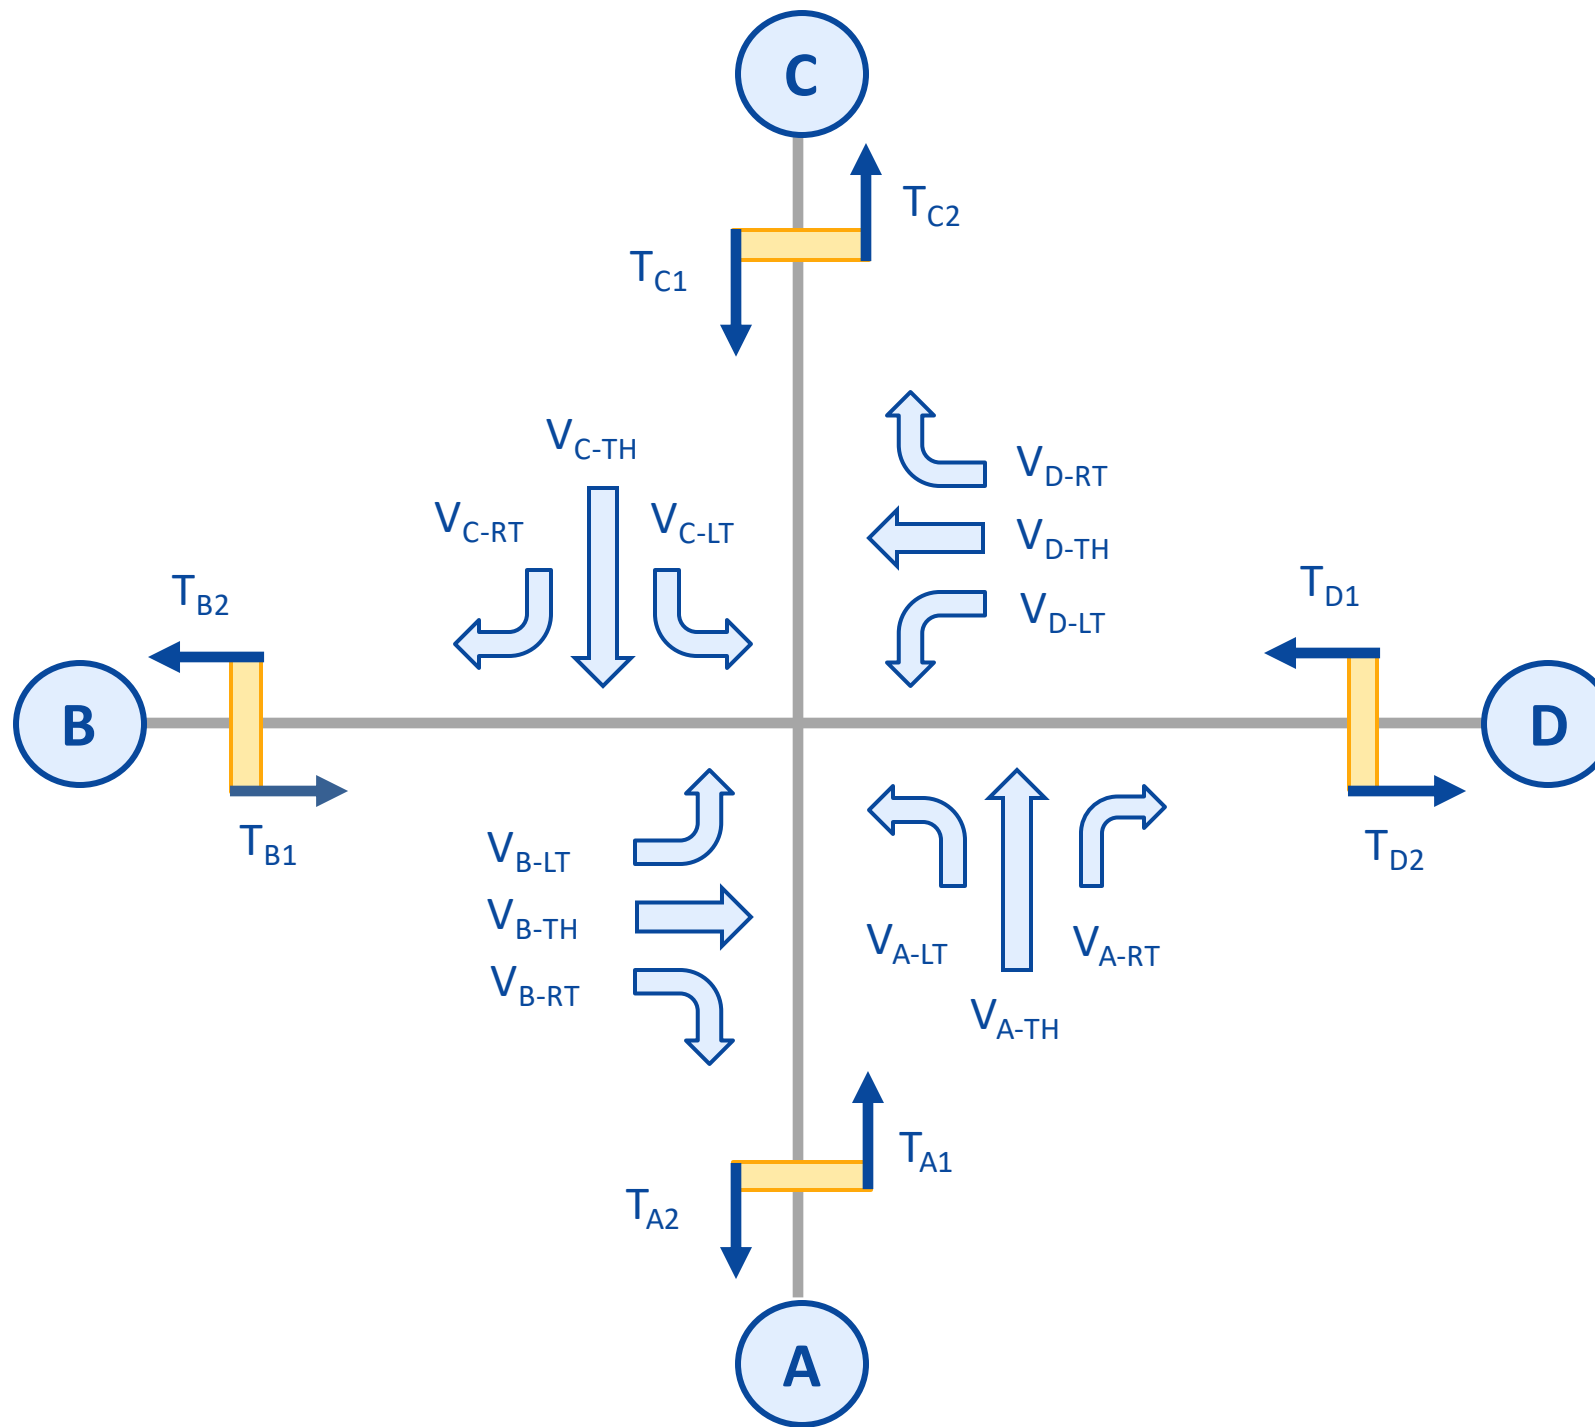

### STEP 3

## Intersect's Balanced Flow Approach

- Ingested data counts
- Sample for multiple hours
- Derive percentages for approaches and turns
- Balanced inbound and outbound volumes

## Deviation For Inbound Traffic:

$$\text{Deviation}_{A1} = \frac{T_{A1}}{(V_{A-LT} + V_{A-TH} + V_{A-RT})}$$

$$\text{Deviation}_{B1} = \frac{T_{B1}}{(V_{B-LT} + V_{B-TH} + V_{B-RT})}$$

$$\text{Deviation}_{C1} = \frac{T_{C1}}{(V_{C-LT} + V_{C-TH} + V_{C-RT})}$$

$$\text{Deviation}_{D1} = \frac{T_{D1}}{(V_{D-LT} + V_{D-TH} + V_{D-RT})}$$

## Deviation For Outbound Traffic:

$$\text{Deviation}_{A2} = \frac{T_{A2}}{(V_{D-LT} + V_{C-TH} + V_{B-RT})}$$

$$\text{Deviation}_{B2} = \frac{T_{B2}}{(V_{A-LT} + V_{D-TH} + V_{C-RT})}$$

$$\text{Deviation}_{C2} = \frac{T_{C2}}{(V_{B-LT} + V_{A-TH} + V_{D-RT})}$$

$$\text{Deviation}_{D2} = \frac{T_{D2}}{(V_{C-LT} + V_{B-TH} + V_{A-RT})}$$

## STEP 3

# Intersect's Balanced Flow Approach

- Balance the in/out for each leg
- Converted to big data environment
- Program is 1.3 million (3-way) and 2.8 billion (4-way) permutations

The screenshot displays a GIS application interface. On the left, a 'Table Of Contents' pane lists various layers, with 'roads' selected. The main map area shows a street network with a highlighted intersection. Below the map, a 'Table' window displays the following data:

FID	Shape	osm_id	name	ref	type	oneway	bridge	maxspeed
71443	Polyline	7546621	Poncana Boulevard		primary	1	0	40
96110	Polyline	15956826	Poncana Boulevard		primary	1	0	40
96111	Polyline	15956828	Poncana Boulevard		primary	1	0	40
96115	Polyline	15956848	Poncana Boulevard		primary	1	0	40

On the right, a code editor window shows JavaScript code for a routing callback function, including calculations for percentage sets and group assignments.

# STEP 4

## Intersect's Process and Data Validation

**STEP 4**

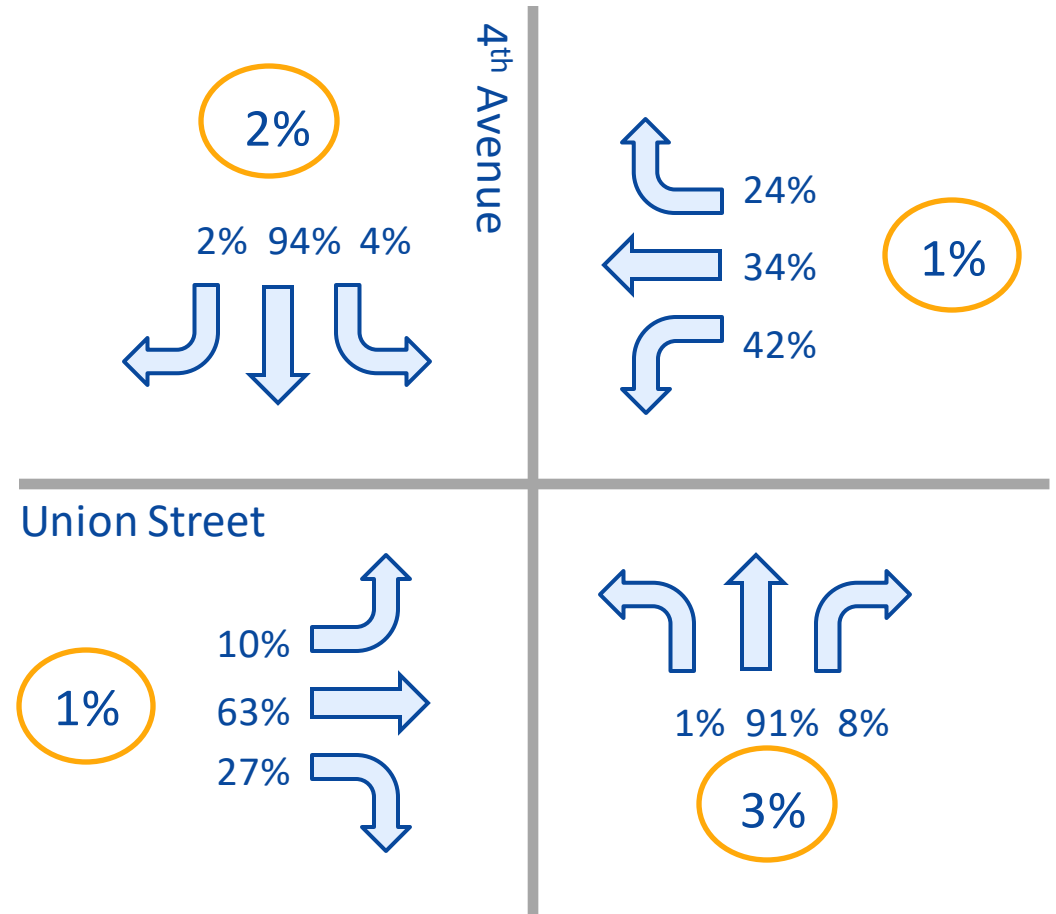

# Intersect's Process and Data Validation

## Urban

### Probe Data (October 2019)

### Historical Data (October 2019)

# Intersect's Valuable Benefits

**24/7 accessible data** for any intersection

**Year-round availability** for data collection—easy adjustments to account for holidays, summer months, etc.

Fewer steps yield **more efficiency and faster results—a cost and time savings**

A larger data set offers **more reliability and accuracy**

**Customizable output**

Virtual collection minimizes field work and **enhances safety**

**Viable tool** during typical and atypical traffic conditions

# Case Studies

# Case Study: University of Southern Maine - Small

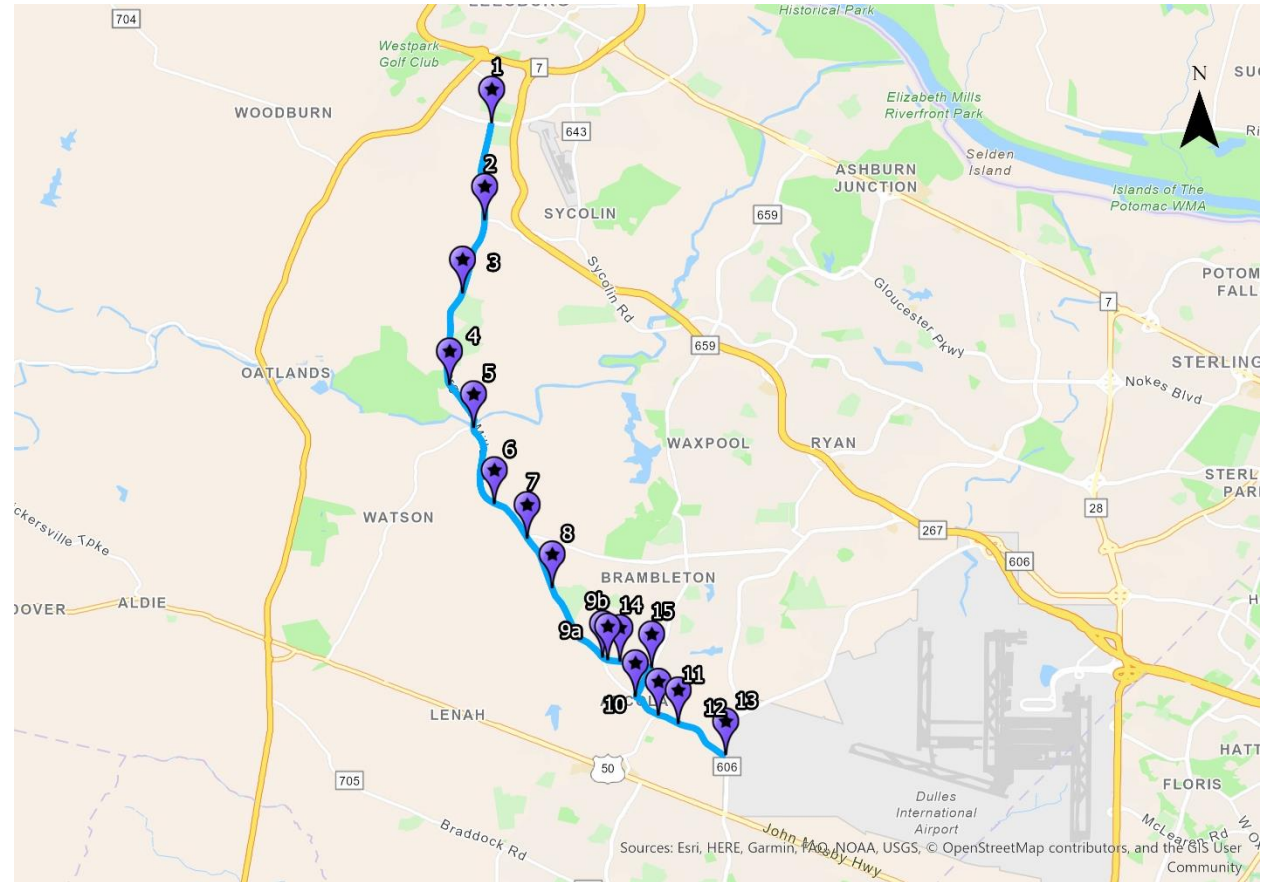

- 2 Locations being studied
- Low volume of traffic
- USM is transitioning from commuter-campus to higher resident population
- Traffic analysis to accommodate a new 580-bed residence hall
- Illustrate project impacts to complete local permitting and submit MaineDOT application

# Case Study: EMR and AMD Planning Study - Medium

- Corridor Study
- 13 locations being studied
- Traffic Analysis to develop representative existing conditions
- Allowed study to proceed without significant delays
- Integrated data validation and verification process leveraging existing counts for calibration
- Level of accuracy in capturing average travel behavior was greater when compared to traditional manual counts

# Case Study: NCDOT – Large Scale

- VHB is managing NCDOT's statewide traffic count program
- Built a system that processes all requests, performs automated QC, and removed redundancy
- Project was paused because of pandemic
- Leverage probe data to generating data to understand seasonal traffic factors for 100 counties (PADT)
- Data used to calculate Volume to Capacity (V/C) ratios for identifying project prioritizations
- Developing a model, including data from continuous count stations for up to 55,000 locations in NC

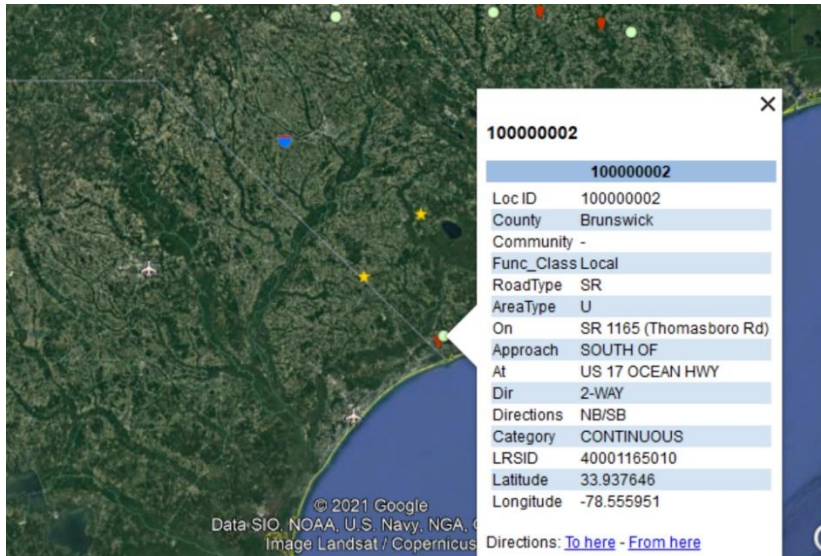

# STEP 4

## Intersect's Process and Data Validation

US 17 at Ocean Highway

Weekly Probe AWD vs Weekly ATR AWD

# Feedback & Questions
